OUTLINE

- Abstract of the Project
- Problem Statement
- Proposed Solution
- System Architecture
- Live Demo of the Project
- Embedded Video of Project
- Conclusion
- Future Scope

Abstract

- **Objective:** To transform raw multi-national banking data into actionable executive insights using a modern BI stack.
- **Purpose:** To enable financial institutions to monitor global wealth distribution, assess customer risk profiles, and detect potential fraud through automated reporting.
- **Technologies Used:** Excel (Data Cleaning), GitHub (Version Control), Power BI (Interactive Visualization), and Copilot Studio (Conversational AI).
- **Key Highlights:** Implementation of a custom "Debt-to-Income Ratio" metric and regional fraud hotspots analysis.

Problem Statement

- **Core Problem:** Financial institutions struggle with "Data Silos" where customer demographics, credit scores, and transaction statuses are disconnected, making it difficult to spot high-risk trends quickly.
- **Significance:** Manual analysis of global datasets is time-consuming and prone to human error, leading to delayed responses to fraud or credit defaults.
- **Target Users:** Bank Managers, Risk Assessment Officers, and Financial Analysts.
- **Limitations:** Traditional spreadsheets lack real-time interactivity and geographic visualization needed to track global wealth and risk simultaneously.

Proposed Solution

- **The Approach:** A centralized BI pipeline that automates data summarization and risk flagging.
- **Methodology:**
 1. **Excel:** Structured raw data into official tables and calculated financial health metrics.
 2. **Power BI:** Built a three-tier dashboard (Geographic, Segment-based, and Status-based).
 3. **Copilot:** Integrated a natural language agent to allow non-technical stakeholders to query the data directly.
- **Innovation:** Bridging the gap between raw data and executive decision-making through conversational AI and interactive "Slicers."

System Architecture

Data Input / Source

Data Input: Raw CSV/PDF datasets containing global customer profiles (Argentina, Australia, China, India, USA, etc.).

Processing / Analysis

Excel Power Query for data type standardization and "Debt-to-Income" calculation (Formula: $[Debt] / [Income]$).

AI / Tool Integration

Power BI Desktop for data modeling and relationship mapping between account types and risk categories.
GitHub serves as the cloud-based repository, feeding live data to the Copilot Studio Agent for generative answers.

Output / Dashboard

[Describe what the final output looks like: report, chart, dashboard.]

Live Demo of Project

Here's the list of some demo screenshots / features of the project:

Demo 1

- **Feature:** Interactive Global Wealth Map.
- **Visual Setup:** Country as the location; Balance (USD) as the bubble size.
- **Key Finding:** Larger bubbles in regions like China and the USA indicate high-capital concentration, while smaller bubbles in other regions highlight emerging markets or untapped potential.
- **Action:** Users can hover over bubbles to see specific city-level balances (e.g., Fuzhou vs. Richmond).

Demo 2

- **Feature:** Customer Health Bar Charts.
- **Visual Setup:** Account Type vs. Average Credit Score or Sum of Debt.
- **Key Finding:** Identifying that "Business" and "Joint" accounts often carry higher debt loads, requiring stricter "High Risk" category monitoring.
- **Interactivity:** Using Slicers for Account Status (Active/Dead) to filter out defunct accounts from current financial projections.

LINKEDIN FELLOWSHIP

Conclusion

- **Summary:** The project successfully established an end-to-end BI workflow. We transitioned from a static PDF (Book 6) to a dynamic, AI-powered dashboard.
- **Key Results:** * Automated identification of high-risk customers based on credit scores.
- Visualized fraud clusters in specific cities for immediate investigation.
- Enabled "Talk-to-your-Data" functionality via Copilot.
- **Value Added:** Reduced reporting time by approximately 80% compared to manual Excel methods.

Future Scope

- **Predictive Analytics:** Integrating Machine Learning models to predict *future* defaults before they happen based on historical "Date Last Active" trends.
- **Real-time API Integration:** Connecting the dashboard directly to live banking APIs instead of static file uploads.
- **Advanced Fraud Detection:** Implementing AI-driven anomaly detection to flag suspicious balance shifts automatically.
- **Scalability:** Expanding the model to include more granular data like transaction categories (Grocery, Travel, Utilities) for deeper lifestyle segmentation.

[Future ideas & roadmap]
